L. Submitted (MAY-1995) to the EMBL/GenBank/DDBJ databases.

- 1 FUNCTION: THE COATOMER IS A CYTOSOLIC PROTEIN COMPLEX THAT BINDS

- 1 FUNCTION: THE COATOMER IS A CYTOSOLIC PROTEIN COMPLEX THAT BINDS

- 1 FUNCTION: TRANSPORT FROM THE EFF WIND THE GOLGI UP TO THE TRANS GOLGI

- 1 REWENRANDES, AND IS ESSENTIAL FOR THE RETROGRADE GOLGI-TO-ER

- 1 SUBGURIT: OLIGOMERIC COMPLEX THAT CONSISTS OF AT LEAST THE ALPHA,

- 2 SUBCELLULAR LOCATION: THE COATOMER IS CYTOPLASMIC OR POLYMERIZED

ON THE CYTOPLASMIC SIDE OF THE GOLGI, AS WELL AS ON THE

VESICLES/BUDS ORIGINATING FROM IT (BY SIMILARITY).

- 1 FUR: THE N-TERMINUS IS BLOCKED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This SWISS-PROT entry is copyright. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                         US-09-441-654A-1

Sequence 103, Application US/09240136

Patent No. 6103499

GENERAL INFORMATION:
APPLICANT: DYAX CORP
APPLICANT: LADNER, Robert C
TITLE OF INVENTION: Inhibitors of Human Plamin Derived
TITLE OF INVENTION: From The Kunitz Domains
NUMBER OF SEQUENCES: 139
CORRESPONDENCE ADDRESS:
ADDRESSEE: Yankwich & Associates
CORRESPONDENCE ADDRESS:
STREET: Cambridge
CITY: Cambridge
CITY: Cambridge
CITY: Massachusetts
                                                                                                                                                                                                                                                                                                                                                                                                                            Length 58;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                              The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 CATVIENAIGDLAISRNAADSSVPSAPRRQDSEDHSSDMFNYEEYCIANAVIGPCRASFP 120

the present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrama, stroke, cerebral or subarachhoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be allowed or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 CATVIENAIGDLAISRNAADSSVPSAPRRQDSEDHSSDMFNYEEYCIANAVIGPCRASFP 127

                                                                                                                                                                                                                                                                                           The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedena, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the Kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be allered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk the contract of the bikunin sequence are side effects, as well as reducing

trypsin, or

inhibit kallikrein, t sclerosis, fibrosis,

Tamburini PP;

Muller DK,

```
The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal carrio cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock changed coaquidation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for cher cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and other cancer, error labour. It has similar properties to apportinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrama, stroke, cerebral or subarachnoid hemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CATVTENAIGDLAISRNAADSSVPSAPRRQDSEDHSSDMFNYEEYCIANAVIGPCRASFP 120

The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less amenopenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treconther cancer, arthritis, anaemia, non-insulin dependent diabscues, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less and the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood or eliminates the need for whole donor of infection and other adverse side effects, as well as reducing

                   The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytramma, stroke, cerebral or subarachnoid heamorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manibulation of the bikunin sequence may allow the inhibitory profile to be all minates the need for whole donor blood or blood or blood creates side effects, as well as reducing

inhibits, e.g. trypic is a nument paracrat Landaud dator XIIa.

Bikunin can be used to treat or prevent brain and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia perioperative blood loss, sepsis, shock, increation subarachnoid haseases, polytrauma, stroke, cerebrai or subarachnoid haseaces, polytrauma, stroke, cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to apportinin, but is less highly to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys. Manipulation is the bikunin sequence may allow the inhibitory profile to be altered it also reduces or eliminates the need for whole donor blood or blood dother adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                     HAI-II, a vector carrying this DNA, and a host cell, pref. an animal cell, transformed with the vector. HAI-II can be used for regulating HGR activator activity and thus HGF activity) in vitro and in vivo. It may also be used for investigating the function of HAI-II in vivo and the effect of HAI-II in hepatic disorders.
                                                                                                                                                                                                                                                                                                that inhibits the protease activity of hepatocyte growth factor (HGF) activator. The sequence was deduced from a cDNA clone (T61439) obtained from cancer cell line MKN45. Also claimed are isolated peptides (W13662-64) of HAI-II, the DNA encoding
                                                                                                                                                                                                       Novel protein HAI-II - inhibits protease activity of hepatocyte growth factor activator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 170; DB 18; Length 252; 100.0%; Pred. The present sequence represents a human tissue factor pathway inhibitor-3 (TFPI-3) which contains two kunitz type domains. The invention also provides the TFPI-3 cDNA and screening methods for identifying agonists and antagonists of TFPI-3. As TFPI-3 inhibits protease activity, its claimed to be useful for, e.g. inhibiting intravascular clotting and preventing the formation of fibrin clotts myor, for treating coronary occlusion with active myocardial infarction and in the prophylaxis and treatment of peripheral arterial embolism, for the treatment of sepsis, inflamments and interpretation and in the prophylaxis and treatment of peripheral arterial embolism, for the treatment of sepsis, inflamments and treatment rejection. TFPI-3 is also claimed to be useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           as an anticoagulant in blood transfusions, extracorporeal circulation, and dialysis procedures and in blood samples for laboratory purposes. The TFPI-3 antagonists are claimed to be useful for promoting coagulation, e.g. in the treatment of haemophilia.
                                                                                                                                                                                                                                                                                                 Isolated tissue factor pathway inhibitor-3 - used to develop products for treating, e.g. pulmonary embolism, thrombosis, sepsis, inflammatory disease, transplant rejection or haemophilia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              28 adrersihdfclvskvvgrcrasmprwwynvtdgscqlfvyggcdgnsnnyltkeecis

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Shkunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, throsis, blood coaquilation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and opportunin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or

New human placental bikunin - used to inhibit kallikrein, trypsin etc. in treatment of oedema, multiple sclerosis, fibrosis, or perioperative blood loss

Claim 1; Page 67; 110pp; English.

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, Kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple cedema, inflammation, infection or granulomatosis, multiple calerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coaquidation diseases, polytrama, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and cout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk the nost of infection and other adverse side effects, as well as reducing

Marlor CW, Muller DK,

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and splnal cord codema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, multiple codema, inflammation prioperative blood loss, sepsis, shock, ibrosis, blood coaquilation diseases, polytrama, stroke, crebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and influenza and infections, acute pancreatitis and inmunogenic and less likely to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys. Manipulation immunogenic and less likely to damage the kidneys wanipulation altered it also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing the cost of surgery

The present sequence is the EST R74593 protein, which is similar to human bikunin. Bikunin inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.
Bikunin can be used to treat or prevent brain and spinal cord oedema, inflammation, infection or granulomatosis, multiple sclerosis, ischkemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and

gout, and prevent pre-term labour. It has similar properties to aprofinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing the cost of surgery.
                                                                                                                                                                                                                          Sequence
